[View alf's Garage](#)**DIY: Rear Sway Bar (H&R 24mm)**

There wasnt a complete one, i put one in on the weekend for a fun run. I decided to go with H&R due to the teflon coating.

the difference is night and day. best mod for the money in the suspension department.

Tools needed:

Triple Square:

-m10
-m6

Sockets:

-Socket Wrench
-16mm
-1/2 (13mm)
-extension

Hand Wrench:(just for tight squeezes)

-1/2(13mm)
-16mm

Screwdriver:

-Flat Head

FIRST: Jack up the car and carefully secure jackstands and the jack points on the chassis of the vehicle.

If you dont have any triple square sockets, you can go to the local autozone, i bought this set for use with a 1/2 socket. \$13.00

This is where the 16mm socket comes in, do the same for both sides.

This is where the m10 Triple Square come in. You can use an extension, over the lower control arm to make it easier. be careful not to strip the bolt. (where the spring sits)

this is where the 1/2 hand wrench came in handy. you can see where the extension can be run through just a little over the lower control arm.

For the H&R there are no new brackets provided. you can use the flat head screw driver to pry off the brackets from the stock bushings. and just slide them over the new bar.

Just slide it right over the Teflon bushing.

A comparison with the new rear sway bar ready to go on, compared to stock.

place the bolt for the endlink in through the new rear sway bar hole (I went for full stiffness) and use the m6 Triple Square along with a 16mm hand wrench to tighten it. (one going counter clock-wise, one going clock-wise)

Now at this point, just repeat at putting the bushings on with the m10 triple square and the extension as well for max use.

please do not over tighten any of the bolts, on other rear sway i think it was 30-35lbs of pressure i believe.

then lower the car, and have fun. =)

the difference is pretty damn noticable, what i did was take a nice turn to find out what the max speed i could take a turn was then took it with the sway bar and i had an increase of 10mph into the turn, everything MUCH more solid.

Enjoy,

alf.

Thanks for the write-up and pics.
Now I just need to find some extra cash.

alf,...

Nice job !

Now to save my pennies for MY H&R 24mm sway bar.

(My GTI wants list is growing proportionally)

hehehe,...*WEG*

i installed the HR 24mm RSB yesterday so i thought i'd add my thoughts. for removal/install i had the back end of the car up on two jack stands.

the set of triple square sockets i got was a little different than the ones alf used:
<http://www.toolfetch.com/Category--H...-SK19704.shtml>

unfortunately i didn't notice that alf found a triple square set at the local autozone because the set i ordered cost twice as much and the length of the bits turned out to be an issue as i had some interference with the control arm when turning the lower bolt on each of the two brackets. i was able to get at it by having a friend push down on the wheel (i.e. moving the control arm a little further out of the way). this may not be an issue on stock suspensions (i have eibach prokit installed) but it seems like it isn't an issue with the autozone bit set anyway since alf didn't mention anything and he looks to have the sportlines installed.

i was able to finagle the stock rsb around the exhaust without "too much" trouble, but for the life of me i couldn't get the new bar into place and ended up having to remove the rear passenger side wheel to give me a little more room.

driving impressions... huge difference 🤖 noticeably less body roll and the car seems to turn in alot better (i'm on at the less stiff of the two settings). i drive the same twisty road everyday and it really seems like the steering wheel requires just a little less turn angle than it did previously to maneuver the same curves.

yea the one shown in the last picture of the first post is the stiffer setting, it results in a shorter moment arm, i.e. more torsional resistance
